that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of the invention. The DNA sequences are recorded on a computer reads medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches us the S.aureus DNA sequences allows putative functions to be assigned that the S.aureus DNA sequences allows putative functions to be assigned.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           claim 1; Page 800-813;

To screening for (ant)agonist, homologous receptors, etc.

Claim 10; Pages 49-50; 72pp; English.

Claim 10; Pages 49-50; 72pp; English or 298 (breakdown product)

This sequence represents cDNA encoding a human imidazoline type 1

Creceptor (IR1), which has 559 (full length) or 298 (breakdown product)

Camino acid residues. The protein is highly unique in its sequence and

Camay represent the first in a novel family of receptor proteins. The cDNA

Can be used to produce recombinant IR1, to screen for ligands binding

IR1, to raise antibodies against IR1 or to probe for other genes encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

This sequence encodes an imidazoline receptor of the invention. Host cells expressing the polypeptides are useful for screening for ligands of an imidazoline receptor. Restriction fragments of the polypurcleotide are useful as labeled probes for isolating and identifying DNA material encoding polypeptides that are receptive to imidazoline compounds. The isolation of polypucleotides encoding the imidazoline receptive polypeptides have immunological and ligand binding properties, which enable identification of agents having greater potency and/or more selectivity for these receptors.

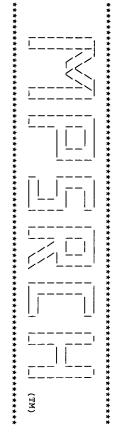

Sequence 1954 BP; 367 A; 645 C; 591 G; 351 T;
Nucleic acid encoding imidazoline receptor subtype screening for (ant)agonist, homologous receptors, e Claim 11; Pages 50-52; 72pp; English.
This sequence represents cDNA encoding a human imid receptor (IR1), which has 559 (full length) or 298
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human imidazoline receptor subtype 1 Imidazoline receptor subtype 1; IR1; antibody; C-terminal fragment; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           receptive polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 amino acid residues. The protein is highly unique in its sequence and may represent the first in a novel family of receptor proteins. The cDNA can be used to produce recombinant IRL, to screen for ligands binding IRL, to raise antibodies against IRI or to probe for other genes encoding homologous IRI proteins.

Release 3.1A John F. Collins, Biocomputing Research Unit. Copyright (c) 1993-1998 University of Edinburgh, U.K. Distribution rights by Oxford Molecular Ltd

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Sat Apr 22 13:20:48 2000; MasPar time 123.15 Seconds 477.985 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: >US-09-422-999-18 (1-849) from US09422999.pep 6222

Scoring table: Sequence: PAM 150 Gap 11 1 MVLWKRALTMTGFLTRRTHL.....VIDNQRTLSQMSHRLEPRRP 849

Searched: 225878 seqs, 69334122 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: sptrembl12 1:sp_archea 2:sp_bacteria 3:sp_fungi 4:sp_human 5:sp_invertebrate 6:sp_mammal 7:sp_mhc 8:sp_organelle 9:sp_phage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Statistics: Mean 53.509; Variance 96.380; scale 0.555

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: >US-09-422-999-18
Description: (1-849) from US09422999.pep
Perfect Score: 6222

Sequence: 1 MVLWKRALIMTGFLTRRTHL.....VIDNQRTLSQMSHRLEPRRP 849

Scoring table: PAM 150 Gap 11

Searched: 82229 seqs, 29864866 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot38
1:swissprot

Statistics: Mean 55.453; Variance 99.565; scale 0.557

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"The CDC25 protein of Saccharomyces cerevisiae promotes exchange of guanine nucleotides bound to ras.";
Mol. Cell. Biol. 11:2641-2646(1991).
-!- FUNCTION: PROMOTES THE EXCHANGE OF RAS-BOUND GDP BY GTP. THIS PROTEIN POSITIVELY CONTROLS THE LEVEL OF CELLULAR CAMP AT START, THE STAGE AT WHICH THE YEAST CELL DIVISION CYCLE IS TRIGGERED.
-!- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                "Characterization, cloning and sequence analysis of the CDC25 which controls the cyclic AMP level of Saccharomyces cerevisia EMBO J. 5:375-380(1986).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "The
